

SALESFORCE PROCESS MAPPING AND DOCUMENTATION

Week 1 Task Report

Prepared By	Nidhrabingi Kavitha
Task	Salesforce Process Mapping and Documentation
Processes Covered	Lead Management • Opportunity Tracking • Case Resolution
Report Type	Process Audit & Optimization Analysis

A simulated Salesforce process audit focused on workflow clarity, operational risks, efficiency, and practical optimization opportunities.

1. Executive Summary

This report documents three critical Salesforce business processes: Lead Management, Opportunity Tracking, and Case Resolution. The objective is to simulate a practical process audit by identifying process inputs, activities, decision points, outputs, operational risks, and opportunities for optimization. The analysis uses standard CRM process concepts and Salesforce workflow practices as the basis for the proposed process maps.

2. Task Objective

The primary objective is to analyze, map, and document key Salesforce processes used in day-to-day business operations. The report converts operational activities into clear process flows so that stakeholders can understand how records move through Salesforce, where decisions are made, and where automation or controls can improve efficiency.

3. Scope and Methodology

The review covers three end-to-end processes. Each process was examined from record creation through completion or closure. The methodology includes identifying inputs and outputs, mapping sequential activities, identifying decision points, assessing inefficiencies and risks, and proposing practical improvements such as validation rules, automation, dashboards, notifications, ownership controls, and standardized data entry.

Key assessment dimensions

- Process clarity and ownership
- Data quality and completeness
- Manual effort and duplicate work
- Timeliness and follow-up
- Decision controls and escalation
- Reporting and visibility
- Automation opportunities

4. Process 1 – Lead Management

Lead Management covers the journey from capturing a potential customer to qualifying the lead and converting it into customer-related records. A structured process helps sales teams prioritize genuine prospects while reducing duplicate, incomplete, or unqualified records.

Inputs

- Lead information such as name, company, email, phone, source, and interest
- Lead source from campaigns, website forms, events, referrals, or manual entry
- Sales ownership and qualification criteria

Process Flow

Decision handling: If the lead meets defined qualification criteria, it is converted and passed into the sales process. If it does not qualify, the record can be marked as unqualified or placed into a suitable nurture path.

Outputs

- Qualified lead converted into appropriate CRM records
- Unqualified lead closed or retained for future nurturing
- Owner and status updated for reporting
- Sales follow-up activity recorded

Potential Inefficiencies and Risks

- Duplicate lead creation can distort pipeline and campaign reporting.
- Incomplete contact details can prevent effective follow-up.
- Manual assignment may delay response to new leads.
- Inconsistent qualification criteria can cause subjective decisions.
- Leads without timely follow-up may become inactive or lost.

Recommended Optimizations

- Use duplicate-management controls and standardized data fields.
- Automate lead assignment using predefined routing rules.
- Create mandatory qualification fields and clear qualification criteria.
- Set follow-up reminders and escalation notifications.
- Build dashboards for lead volume, source, conversion, age, and owner performance.

5. Process 2 – Opportunity Tracking

Opportunity Tracking manages potential revenue from initial sales engagement through qualification, proposal, negotiation, and closure. Consistent stage definitions and required information at each stage improve forecast reliability and management visibility.

Inputs

- Converted lead or existing account/contact
- Opportunity name, amount, close date, owner, and source
- Customer requirements, products/services, activities, and notes

Process Flow

Opportunity Created	→	Qualification	→	Needs Analysis	→	Proposal	→	Negotiation	→	Closed Won/Lost
---------------------	---	---------------	---	----------------	---	----------	---	-------------	---	-----------------

Decision handling: At each stage, the opportunity should satisfy defined entry/exit criteria before moving forward. At closure, the reason for winning or losing should be captured for analysis.

Outputs

- Updated opportunity stage and probability
- Accurate pipeline and forecast information
- Closed Won revenue or Closed Lost reason
- Sales activity history and management reporting

Potential Inefficiencies and Risks

- Stages may be updated inconsistently across sales users.
- Opportunities can remain stale without regular activity.
- Missing close dates, amounts, or loss reasons reduce forecast quality.
- Excessive manual updates consume sales time.
- Poor visibility into aging opportunities can delay intervention.

Recommended Optimizations

- Define clear stage entry and exit criteria.
- Use validation rules for critical opportunity fields.
- Automate reminders for inactive or aging opportunities.
- Standardize Closed Lost reasons and competitor information.
- Use pipeline dashboards and forecast reports for management review.

6. Process 3 – Case Resolution

Case Resolution manages customer support issues from creation through assignment, investigation, communication, resolution, and closure. A consistent case process improves response time, accountability, service quality, and customer visibility.

Inputs

- Customer issue or service request
- Customer/account information
- Case origin, priority, category, and description
- Attachments or supporting information

Process Flow

Case Created	→	Categorize & Prioritize	→	Assign	→	Investigate	→	Resolved?	→	Close / Escalate
--------------	---	-------------------------	---	--------	---	-------------	---	-----------	---	------------------

Decision handling: If the issue can be resolved by the assigned support team, the resolution is recorded and the case is closed. If additional expertise or authority is required, the case is escalated according to defined rules.

Outputs

- Resolved customer issue
- Resolution notes and customer communication history
- Escalation record where required
- Closed case and service metrics

Potential Inefficiencies and Risks

- Incorrect categorization can route cases to the wrong team.
- Cases may remain open without timely follow-up.
- Manual escalation can increase resolution time.
- Incomplete resolution notes reduce knowledge reuse.
- Lack of SLA monitoring can affect customer satisfaction.

Recommended Optimizations

- Use standardized case categories and priority definitions.
- Automate assignment and escalation based on case attributes.
- Set SLA-based alerts and escalation notifications.
- Require meaningful resolution notes before closure.
- Create dashboards for case volume, aging, SLA compliance, and resolution time.

7. Cross-Process Risk and Improvement Analysis

The three processes share several operational risks. The following controls can be applied across the Salesforce environment.

Area	Observed Risk	Recommended Control
Data Quality	Incomplete or duplicate records	Validation, required fields, duplicate controls
Ownership	Records may lack timely action	Automated assignment and ownership monitoring
Follow-up	Stale leads, opportunities, or cases	Reminders, aging alerts, escalation rules
Process Consistency	Users may follow different practices	Standard stages, criteria, and documentation
Visibility	Management may lack real-time insight	Dashboards and reports
Manual Work	Repetitive updates consume time	Flow automation and notifications

8. KPI and Reporting Recommendations

A small set of consistent KPIs can make the processes measurable and support continuous improvement.

- Lead conversion rate, lead response time, lead aging, and source performance
- Opportunity pipeline value, stage aging, win rate, average sales cycle, and forecast accuracy
- Case volume, first response time, average resolution time, SLA compliance, reopened cases, and escalation rate

9. Overall Optimization Strategy

The recommended strategy is to combine process standardization with targeted automation. First, define clear ownership and data requirements. Second, automate repetitive routing, notifications, reminders, and escalation activities. Third, establish dashboards that allow managers to detect aging records and performance gaps. Finally, review process metrics periodically and refine rules based on actual operational results.

10. Key Findings

Lead Management benefits from stronger qualification and routing. Opportunity Tracking benefits from consistent stage criteria and pipeline hygiene. Case Resolution benefits from automated assignment, SLA monitoring, and structured escalation. Across all three processes, the strongest common opportunities are better data quality, clearer ownership, reduced manual work, and improved reporting visibility.

11. Conclusion

This process audit demonstrates how Salesforce workflows can be documented from an operational perspective. Clear process maps make responsibilities and decision points easier to understand, while risk analysis highlights where delays, data-quality issues, and manual work can affect performance. The proposed optimizations focus on practical Salesforce capabilities such as validation, automation, assignment, notifications, dashboards, and standardized processes.

12. References / Best-Practice Basis

Salesforce product documentation and publicly available CRM process-management best practices were used as general reference points for the process concepts in this simulation. The report is an academic/process-audit

simulation and does not represent an audit of a specific organization's live Salesforce environment.
